A few years earlier, A.H. Compton had shown that the nature of X-rays changes when passed through matter. The change was dependent on the kind of matter. This effect was called the 'Compton Effect'.

Could light also change its nature when passed through a transparent medium ? That was the question that Raman asked himself. For five years he had been doing research in optics, the science of light. No sophisticated equipment was available in his laboratory, but Raman was confident that he could find the answer with some modifications in his equipment.

Four months later, on March 16, 1928, Raman announced his discovery of 'new radiation' (describing the behaviour of a beam of light passing through a liquid chemical) to an assembly of scientists at Bangalore (now call Bengaluru).

One evening, when Taro and his parents were sitting in a corner of their hut, a strong wind began to blow. It whistled through the cracks of the hut and everyone felt very cold. Suddenly, Taro's father said, "I wish I had a cup of sake (a popular Japanese drink); it would warm me and do my old heart good."

This made Taro sadder than ever, for the heart-warming drink called sake was very expensive. "How do I earn more money?" he asked himself. 'How do I get a little sake for my poor old father?' He decided to work harder than before.
